Package Sewage Pumping Stations

*****Technical Data Sheet*****

The picture on the right shows our **Standard Range of Sewage Pumping Packages**, each with a GRP pedestrian manhole cover manufactured as part of the integral product.

The SP500 is shown in the foreground being the smallest in the range it is useful where ground conditions dictate a shallow hole only can be dug. The SP1000 is on the right, being the most popular in the range is designed to take one pump. The Double chamber on the left will accommodate two pumps. All chambers are fitted with two 4" inlets on opposite sides for ease of installation.

Special Sewage Pumping Chambers

can be manufactured to suit individual requirements. The picture on the left shows two chambers recently made for the Chard Guildhall in Somerset, the one on the left is 3.5 metres tall, the right hand one is 3.0 metres long, both are double chambers with our standard pedestrian covers fitted. These were made because the design of the building dictated a low invert level, other "specials" produced have had load bearing covers. Because we have control over the manufacture we are able to offer a wide range of possibilities to suit individual site conditions.

Control panels are also made "in-house" so again these can be custom made if requirements vary from the norm. Ask our sales office for a quotation.

Manufacturers reserve the right to change specifications without prior notice
